I have put in texture to maya before. Like the ones I've worked on for the animation project class. They preferred us to use AistanderedSurface and they had other things to plug in that they preferred so I did that that way because I might give this to the film we are working on. The biggest struggle with this was lighting. Because of the plastic texture, if the light was too harsh it would make the fan appear to be white not black so I had to balance the light in a way that its true colors were shown. I had to fidget with the lights till I got them to where I liked them.
