For this modular project I decided to do pipes. The cool part is that for the group animation class the film I chose to work on they wanted me to make pipes as well so it works for both classes.

I made 3 pipe connectors and 3 different sized pipes. One cool thing I learned about pipes while making this is that some of the ends of the pipes are tapered so they can fit better in the connectors. Its small details like that I learn that can make a big difference when it comes to getting the model ready. I also learned how to use the sweep mesh too, and how to merge vertices together which helped out a lot in making it.
